

Decision Tree

Data

Weather	Humidity	wind	play
Sunny	High	Weak	No
Sunny	Normal	Weak	No
Sunny	Normal	Strong	No
Cloudy	High	Weak	No
Cloudy	High	Strong	No
Cloudy	Normal	Strong	Yes
Cloudy	Normal	Weak	Yes
Rainy	High	Weak	Yes
Rainy	Normal	Strong	Yes
Rainy	Normal	Weak	Yes

Steps

- i) Choosing Target Attribute (T.A)
- ii) Calculating Information Gain (I.G) of T.A.

$$I.G = \frac{P}{P+N} \log_2 \left(\frac{P+N}{P} \right) - \frac{N}{P+N} \log_2 \left(\frac{N}{P+N} \right)$$
- iii) ~~then~~ Entropy of other Attributes, with

$$E(A) = \sum_{i=1}^N \frac{P_i + N_i}{P+N} \times I(P_i, N_i)$$

- iv) Subtracting $E(A)$ from I.G of each Attribute for Gain for particular attributes. (root, leaf, child etc. etc. etc.)

Formulas

$$I.G = \frac{-P}{P+N} \log_2 \left(\frac{P}{P+N} \right) - \frac{N}{P+N} \log_2 \left(\frac{N}{P+N} \right)$$

$$E(A) = \sum_{i=1}^N \frac{P_i + N_i}{P+N} \times I(P_i N_i) \rightarrow \text{probability}$$

$$Gain = I.G - E(A)$$

Solve:

Let's assume Target Attribute is play.

\therefore I.G for Play;

$$I.G = - \frac{P}{P+N} \log_2 \left(\frac{P}{P+N} \right) - \frac{N}{P+N} \log_2 \left(\frac{N}{P+N} \right)$$

$$= - \frac{5}{5+5} \log_2 \left(\frac{5}{5+5} \right) - \frac{5}{5+5} \log_2 \left(\frac{5}{5+5} \right)$$

$$= - \frac{1}{2} \log_2 \left(\frac{1}{2} \right) - \frac{1}{2} \log_2 \left(\frac{1}{2} \right)$$

$$= - \frac{1}{2} \log_2 (2^{-1}) - \frac{1}{2} \log_2 (2^{-1})$$

$$= \frac{1}{2} + \frac{1}{2}$$

2

Weather

	No	Yes
Sunny	3	0
Cloudy	2	2
Rainy	0	3

$$E(A). \text{Sunny} = -\frac{P}{P+N} \log_2 \left(\frac{P}{P+N} \right) - \frac{N}{P+N} \log_2 \left(\frac{N}{P+N} \right) \times I.P.N$$

$$= -\frac{3}{3} \log_2 \left(\frac{3}{3} \right) - \frac{0}{3} \log_2 \left(\frac{0}{3} \right) \times \frac{3}{10}$$

$$= 0 \times \frac{3}{10}$$

$$= 0$$

$$E(A). \text{Cloudy} = -\frac{2}{4} \log_2 \left(\frac{2}{4} \right) - \frac{2}{4} \log_2 \left(\frac{2}{4} \right) \times \frac{4}{10}$$

$$= -\frac{1}{2} \log_2 \left(\frac{1}{2} \right) - \frac{1}{2} \log_2 \left(\frac{1}{2} \right) \times \frac{4}{10}$$

$$= 1 \times \frac{4}{10} = 0.4$$

$$E(A). \text{Rainy} = -\frac{0}{3} \log_2 \left(\frac{0}{3} \right) - \frac{3}{3} \log_2 \left(\frac{3}{3} \right) \times \frac{3}{10}$$

$$= 0 \times \frac{3}{10}$$

$$= 0$$

$$\therefore E(\text{weather}) = 0 + 0.4 + 0 = 0.4$$

$$\therefore \text{Gain}(\text{weather}) = 1 - 0.4 = 0.6$$

Humidity

	No	Yes
High	3	1
Normal	2	4

$$\begin{aligned} E(\text{High}) &= -3/4 \log_2(3/4) - 1/4 \log_2(1/4) \times \frac{4}{10} \\ &= 0.8113 \times \frac{4}{10} = 0.325 \end{aligned}$$

$$\begin{aligned} E(\text{Normal}) &= 2/6 \log_2(2/6) - 4/6 \log_2(4/6) \times \frac{6}{10} \\ &= 0.9183 \times \frac{6}{10} = 0.551 \end{aligned}$$

$$\therefore E(\text{Humidity}) = 0.325 + 0.551 = 0.876$$

$$\therefore \text{Gain}(\text{Humidity}) = 1 - 0.876 = 0.124$$

Wind

	No	Yes
Weak	3	3
Strong	2	2

$$\begin{aligned} E(\text{Weak}) &= -3/6 \log_2(3/6) - 3/6 \log_2(3/6) \times \frac{6}{10} \\ &= 1 \times \frac{6}{10} = 0.6 \end{aligned}$$

$$\begin{aligned} E(\text{Strong}) &= 2/4 \log_2(2/4) - 2/4 \log_2(2/4) \times \frac{4}{10} \\ &= 1 \times \frac{4}{10} = 0.4 \end{aligned}$$

$$\therefore E(\text{Wind}) = 0.6 + 0.4 = 1$$

$$\therefore \text{Gain}(\text{Wind}) = 1 - 1 = 0$$

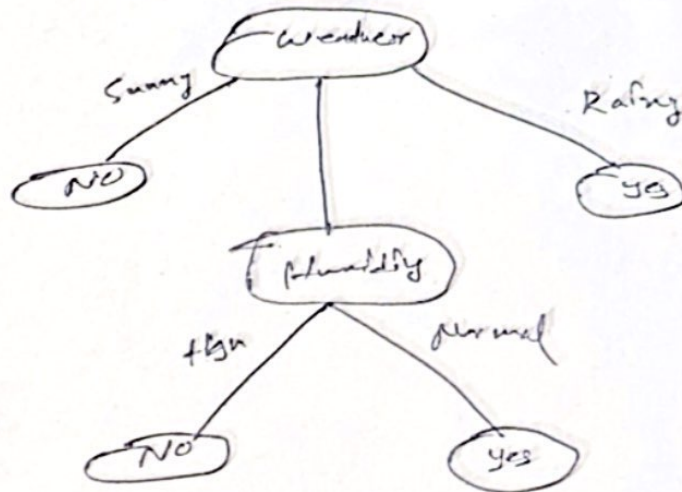

∴ Decision Tree

Here,

$$\text{Gain}(\text{Weather}) = 0.6$$

$$\text{Gain}(\text{Humidity}) = 0.129$$

$$\text{Gain}(\text{Wind}) = 0$$
